Lipodissolve

What is Lipodissolve or Lipolysis?

'Lipo' means fat and 'lysis' means dissolving; so, Lipolysis is a term used to describe the process of dissolving fat by means of injection.

How does Lipodissolve work?

Lipodissolve uses PHOSPHATIDYLCHOLINE [PTC] as the main ingredient to breakdown the fat. Although PTC is naturally found in the body the PTC used in lipodissolve is derived from soybeans. You should not have the treatment if you are allergic to soybeans. PTC is injected with very fine needles directly into the unwanted fat deposits. The fat is broken down into a soluble form and removed by normal liver and kidney function.

Can you really melt fat by injection?

Many years of extensive experience throughout Europe and America has shown this to be a very safe and effective way of removing fat from any stubborn areas. The stomach, back, thighs, buttocks, neck and arms may all be treated. For the success of this procedure anti-aging cosmetic practitioners have been specially trained in an innovative lipolysis technique exclusive to our clinics.

Is this treatment safe?

Unlike liposuction and surgery, it is not associated with the risks of general anaesthesia or sedation, and the other complications of surgery.
